Search Notes

Dear Examiner:

Please find attached the results of your search for the above-referenced case. The search was conducted in Dialog.

I have listed references of *potential* interest in the first part of the search results. However, please be sure to scan through the entire report. There may be additional references that you might find useful.

If you have any questions about the search, or need a refocus, please do not hesitate to contact me.

Thank you for using the EIC, and we look forward to your next search!

EIC 3600, US Patent & Trademark Office

Alerting Abstract US A1

NOVELTY - Prescribing and dispensing of prescription pharmaceutical products includes encoding formed pharmaceutical product media with information that identifies prescription pharmaceutical products; issuing the product media to one or more prescribers; transferring the electronically activated product media from a prescriber to a patient; and presenting the activated product media to a pharmacy that fills the prescription identified by the product media.

DESCRIPTION - Prescribing and dispensing of prescription pharmaceutical products includes forming pharmaceutical product media and encoding that media with information that identifies one or more particular prescription pharmaceutical products; issuing the pharmaceutical product media to one or more prescribers; electronically activating the pharmaceutical product media and transferring the activated pharmaceutical product media from a prescriber to a patient, where the activated pharmaceutical product media identifies one or more prescription pharmaceutical products that have been prescribed by the prescriber for the patient; and presenting the activated pharmaceutical product media to a pharmacy that fills the prescription identified by the pharmaceutical product media.

USE - For prescribing and dispensing prescription pharmaceutical products.

ADVANTAGE - The inventive method allows prescription drugs to be tracked such that appropriate reporting may be performed about the dispensation of prescription drugs outside the sample context. It contemplates the prescriber prescribing the pharmaceutical trial product to the patient and the filling of that prescription by the participating pharmacy. It manages, tracks, and records selected transactions involving the participating prescribers, pharmacies and patients.

DESCRIPTION OF DRAWINGS - The figure is a schematic illustration of a system for managing the distribution of pharmaceutical trial products.

Alerting Abstract US A

The method involves forming a product trial card (18) with a specific information for identifying a particular pharmaceutical trial product. The card is then distributed to several prescribing physicians. The physicians activate the product trial card by communicatively linking the presented card with a central computing station (12) through a terminal (14). The central computing station records the encoded information from the card into the database and activates the product trial card. The activated card is then issued to a patient by the physician. The patient presents the activated card to a pharmacy. The pharmacy validates the product trial card, presented by the patient, by communicatively linking the activated card to the central computing station.

The central computing station judges the activation of the presented card. When the card is found to be activated, the dispensing of the pharmaceutical product identified by the card is approved. In the validation process, the data from the activated card is entered into the pharmacy terminal and the entered data is then transferred to the central computing station. After the validation, the trial product is dispensed to the patient. The products distributed by the pharmacies are periodically accounted with the records at the database in the central computing station.

ADVANTAGE - Manages track and record distribution of trial products effectively and efficiently. Ensures integrity and accountability of product through distribution process. Provides computerised records of selected transactions. Eliminates need for specifying specially packed drugs separately from normally packed drugs. Reduces costs associated with drug manufacturing, storing and distribution processes.

ABSTRACT EP 999506 A1

A new and improved method of dispensing, tracking and managing pharmaceutical product samples by communicatively linking prescribers and pharmacies to a central computing station. The present invention entails utilizing product trial media that is exchanged for actual pharmaceutical product. The media is encoded with information that identifies a particular pharmaceutical trial product, such as by magnetic encoding similar to that used with credit cards. The media is distributed to participating medical doctors or prescribers who then activate the media via the central computing station. The prescriber then transfers the activated media to patients who then present the media to participating pharmacies. Before filling the pharmaceutical trial product identified by the media, the pharmacy validates the media via a link with the central computing station. Then, the pharmacy dispenses the prescribed pharmaceutical trial product. The central computing station also includes a database that records data related to the use of the media so that all pharmaceutical trial products can be accounted for.

...polling each station with periodic async addressed messages to assign
e.g. active state to be maintained until next periodic message
is received

Original Titles:

Sleep mode and contention resolution within a common channel medium
access method

Alerting Abstract...The method involves polling each station with periodic asynchronously timed addressed messages to assign either an active state to be maintained until after the next periodic message is received, for enabling an addressed station to receive data transfer messages transmitted from the system or to assign permission to be inactive for a period of time specified in that message and after which a further periodic message will be received to renew the instruction...

...That arrangement reduces power supply to the circuit functions in the addressed station until the indicated inactive time has expired. A poll acknowledgement message is then transmitted from the addressed station to the system to confirm the active or inactive status to the system of that addressed station until the next poll...

Claims:

A method for sleep mode control for a wireless data communication network that serves battery-powered portable stations having an active mode with full functional capability and a quiescent mode where function is minimized for the purpose of reducing quiescent power drain, and where said stations automatically switch between these modes in response to user needs, and where said data communication network uses a system with a plurality of wireless access-points controlled from a common processor, and having an access method based upon exchange of data...

...invitation-to-request-service messages, said method for sleep mode control comprising the steps of: polling each station with periodic asynchronously-timed addressed messages to assign either an active state to be maintained until after the next periodic message is received, thereby enabling an addressed station to receive data transfer messages transmitted from the system or to assign permission to be inactive for a period of time specified in that message and after which a further periodic message will be received to renew the instruction, thereby reducing power supply to the circuit functions in said addressed station until the indicated inactive time has expired; transmitting a poll acknowledgement message from said addressed station to the system to confirm the active or inactive status to the system of that addressed station until the next poll; and transmitting a poll acknowledgement message from said addressed station to the system to advise...

Original Abstracts:

...further includes a system processor (26), a random access main memory, a read only memory (36) and a switching means. The switching means generates a signal to indicate a mode for whether BIOS loads from either diskette or disk. In a priority mode, BIOS loads immediately from diskette. In a recovery mode, BIOS loads from diskette after testing the disk subsystem. The read only memory (36) includes a first portion of BIOS and data representing the type of system processor (26) and system planar (24) I/O configuration. The first portion of BIOS initializes the system (10) and queries the switching means. If the fixed disk is not available or the master boot record on the disk is invalid, the first portion of BIOS reads in a master boot record from the diskette drive (66). For either mode, the master boot record includes a data segment (122-138) and an executable code segment (120). The data segment (122-138) includes data representing system hardware and a system configuration which is supported

Claims:

...BIOS resident in the read only memory (36), the first portion of BIOS initializing the system (10); a master boot record included in the diskette media, the master boot record including an executable code segment (120); means for producing a signal, the signal being representative of loading BIOS from the diskette drive (66)...

...BIOS is to be loaded from the diskette drive (66) or fixed disk drive (62), wherein if BIOS is to be loaded from the diskette media, the first portion of BIOS initializes the diskette drive (66) to effect the loading of the master boot record into the random access memory (32); a remaining portion of BIOS included in the diskette media, wherein

the first portion of BIOS transfers control to the executable code segment (120) of the master boot record in order to effect the loading of the...

...read only memory containing the portion of BIOS for system initialization (36), a random access memory (32) and a fixed disk drive (62). The diskette media includes a master boot record with an executable code segment (120). The system also has a device for producing a signal that is representative of loading BIOS from the...

...If BIOS is to be loaded from the diskette media, the first portion of BIOS initializes the diskette drive to effect the loading of the master boot record into the random access memory. The first portion then transfers control...

...BIOS resident in the read only memory (36), the first portion of BIOS initializing the system (10); a master boot record included in the diskette media, the master boot record including an executable code segment (120); means for producing a signal, the signal being representative of loading BIOS from the diskette drive (66); means being responsive to the signal for determining if BIOS is to be loaded from the diskette drive (66) or fixed disk drive (62), wherein if BIOS is to be loaded from the diskette media, the first portion of BIOS initializes the diskette drive (66) to effect the loading of the master boot record into the random access memory (32); a remaining portion of BIOS included in the diskette media, wherein the first portion of BIOS transfers control to the executable code segment (120) of the master boot record in order to effect the loading of the remaining portion of BIOS into the random access memory (32).

...uses network controller having sleep mode and connected to network by transceiver

Alerting Abstract ...The system has a network controller having a sleep mode and a transceiver for connecting the controller to a data processing network. The controller is configured for allowing a sleep mode for a data processing node connected to the network controller

...The transceiver is configured to monitor for transmissions on the data processing network. When the node is in the sleep mode. The transceiver is further configured to initiate awakening of the controller when a transmission on the data processing network intended for the data processing node...

...ADVANTAGE - Network controller will operate in sleep mode to conserve power, but portion of controller remains active to monitor for transmissions.

Equivalent Alerting Abstract ...The system has a network controller (30) with a sleep mode and a transceiver (37) to connect the network controller to a data processing network. The network controller is configured for a sleep mode for a data processing node connected to the network controller. The data processing network is configured to repetitively signal its presence to the transceiver when the data processing node is in the sleep mode. The data processing node is configured to awake from the sleep mode in response to the transceiver receiving a transmission with an instruction field with a node address for the data processing node and an awaking instruction...

...ADVANTAGE - Network controller operates in sleep mode so conserves power, terminal can be powered up or powered down from central network system power consumption of Ethernet connection managed by operating software/hardware.

Original Abstracts:

...10BASE-T physical interface for 802-3/Ethernet is that the health of the communications link can be permanently monitored. When in the "link good" condition, the 10BASE-T transceiver is required to output a link status (LNKST) signal to this effect. Media Access Controller (MAC) 30, with an embedded 10BASE-T transceiver (37), uses the LNKST signal to provide power management to the MAC (30). By using the programmable AWAKE bit, the receive section of the 10BASE-T transceiver (37) can remain powered, even if the SLEEP input to the MAC (30) is activated. This allows the transceiver (37) to detect a link beat pulse (60) or receive packet activity. If either receive condition is encountered, the internal transceiver (37) will activate the LNKST output from the MAC (30). The system hardware and/or software can use the LNKST output to take appropriate action. For instance, if the LNKST output is active (low), then the computer is connected to an active network, and it is likely that the operating system will allow the MAC (30) to remain powered. However, if the LNKST becomes inactive (high) then the system can assume that the link is inactive, and the MAC can be powered down to save power. If at a later time the link is re-established, the MAC (30) can be powered back up to...

... 10BASE-T physical interface for 802.3/Ethernet is that the health of the communications link can be permanently monitored. When in the "link good" condition, the 10BASE-T transceiver is required to output a link status (LNKST) signal to this effect. Media Access Controller (MAC) 30, with an embedded 10BASE-T transceiver (37), uses the LNKST signal to provide power management to the MAC (30). Claims:

1. A network connection system comprising a network controller having a sleep mode and a transceiver for connecting said network controller to a data processing network, said network controller being configured for allowing a sleep mode for a data processing node connected to said network controller, said transceiver being configured to monitor for transmissions on the data processing network when the data processing node is in the sleep mode.

... A method for operating a local area network, which comprises connecting a data processing terminal (34) to an Ethernet local area network through an Ethernet media access controller (MAC) (30) and an Ethernet 10 Base-T transceiver (37), and comprising periodically signalling the presence of the network to the transceiver, the method being characterised by the steps of: while the media access controller assumes a power saving sleep mode, a receive section of the transceiver remains awake; signalling the presence of the network to said receive section of the transceiver (37) when the media access controller is in the sleep mode; and awakening the media access controller from the sleep mode in response to said transceiver receiving from the network a packet transmission including a node address for the data processing terminal and an awakening instruction.

... A network connection system comprising a network controller having a sleep mode and a transceiver for connecting said network controller to a data processing network, said network controller being configured for allowing a sleep mode for a data processing node connected to said network controller, the data processing network being configured to repetitively signal its presence to said transceiver when the data processing node is in the sleep mode and said data processing node being configured to awake from the sleep mode in response to said transceiver receiving a transmission including an instruction field including a node address for the data processing node and an awaking instruction.

Original Abstracts:

Method and apparatus for simulating a magnetic tape storage equipment in a data processing system. Method for simulating read time operations of a magnetic tape storage equipment, in which the simulating apparatus (17, 18) receives an arbitrary length train of...

...but requires presently disclosed adaptation for effecting the substitution efficiently and with complete transparency to unaltered parts of the environmental (host) network. While simulating a data recording operation the substituted system receives an arbitrary length train of data bytes clocked at a first rate followed by a cyclic redundancy check (CRC) byte timed at a slower second rate. In order to maintain network transparency, the substituted system must retransmit the data and CRC check bytes, in their received order and at their respective reception rates, after a delay associated with the physical separation between recording and...

...operates to generate an LRC character--which in the native tape equipment is formed directly by the action of resetting magnetization levels in bit track recording heads operating in NRZI mode--and to cause delayed transmission of that character immediately following the echoed CRC character.

Claims:

...sequence of check byte signals timed at a second rate different from said first rate, said signals being stored by said equipment on magnetic tape media subject to manual handling, said method consisting in replacing said tape equipment with an auxiliary processing system performing all of the functions of said tape equipment and presenting an interface (21), to said primary system for signal reception and echoing, which is identical to the interface presented by said tape equipment, but providing not available in said tape equipment and eliminating the manual handling of tape media; said method being characterised...

... SPECIFICATION amounts invested in states which did not occur are completely reallocated to the state which did occur (less any transaction fee). The present invention is not limited to a canonical DRF, and many other types of DRFs can be used and may be preferred to implement a group of DBAR contingent...

... state occur. DBAR digital options, described in Section 6, are an example of an investment with a desired payout distribution should one or more specified states occur. Such a payout distribution could be denoted  $P_i$ , which is a row corresponding to trader  $i$  in payout matrix  $P$ . Such a trader may be traded for a given state  $i$  in ... stock would be sold (or 'not owned') and a string of DBAR contingent claims, including, for example, digital options, based on quarterly earnings can be used as a hedge or insurance for stock believed to be overpriced. Market expectations for a company's earnings may be faulty, and may threaten the... additional features compared to groups of DBAR contingent claims that offer fixed payouts for a state, regardless of the magnitude of the outcome within that state. These features may prove useful in constructing groups of DBAR contingent claims which are able to readily provide risk and return profiles similar to those...

... systems and methods of the present invention is that, in preferred embodiments, traders can generate an arbitrary distribution of payouts across the distribution of defined states for a group of DBAR contingent claims. The ability to generate a customized payout distribution may be important to traders, since they may desire to...

... be achieved. In preferred embodiments, this multi-state investment is entered into a suspense account maintained by the exchange, which reallocates the investment among the states as the amounts invested change across the distribution of states. In preferred embodiments, as discussed above, a final allocation is made at the end of the trading period when returns are finalized.

The discussion in...

... In preferred embodiments, these investments are reallocated using the same procedure throughout the trading period as the relative proportion of amounts invested in the constituent states changes.

In other preferred embodiments, a trader may make a multi-state investment in which the multi-state allocation is not intended to generate the same...

... is also used:

$A_i$ , where  $i$  denotes the  $i$ -th row of the matrix  $A$  containing the invested amounts by trader  $i$  for each of the  $n$  states of the group of DBAR contingent claims.

In preferred embodiments, the allocation of amounts invested in all the states which achieves the desired payouts across the distribution of states can be calculated using, for example, the computer code listing in Table 1 (or functional equivalents known to one of skill in the art), or, in the case where a trader's multi-state investment is small relative to the total investments already made in the group of DBAR contingent claims, the following approximation:  $A_i \cdot T = P_i - 1$ ...

... the trader's desired payouts. The equation above shows that the amounts to be invested in order to produce a desired payout distribution are a function of the desired payout distribution itself ( $P_i$ ) and the amounts otherwise invested across the distribution of states (which are used to form the matrix  $P$ , which contains the payouts per unit along

its diagonals and zeroes along the off-diagonals). Therefore, in preferred embodiments, the allocation of the amounts to be invested in each state will change if either the desired payouts change or if the amounts otherwise invested across the distribution change. As the amounts otherwise invested in various states can be expected to change during the course of a trading period, in preferred embodiments a suspense account is used to reallocate the invested amounts,  $A_i$ ), in response to these changes, as described previously. In preferred embodiments, at the end of the trading period a final allocation is made using the amounts otherwise invested across the...

...code listing in Table 1.

Example 3.1.21 illustrates a methodology for generating an arbitrary payout distribution, using the event, termination criteria, the defined states, trading period and other relevant information, as appropriate, from Example 3.1.1, and assuming that the desired multi-state investment is small in relation to the total amount of investments already made. In Example 3.1.1 above, illustrative investments are shown across the distribution of states representing possible closing prices for MSFT stock on the expiration date of 8/19/99. In that example, the distribution of investment is illustrated for...an actual outcome within a state is determined with reference to the price which falls exactly in between the upper and lower bounds of the state as measured in units of probability, i.e., the "state average." For this Example 3.1.21, the following desired payouts can be calculated for each of the states the amounts to be invested in each state and the resulting investment amounts to achieve those payouts: The far right column of Table 3.1...

...invention described in this specification.

As discussed above, if many traders make multi-state investments, in a preferred embodiment an iterative procedure is used to allocate all of the multi-state investments to their respective constituent states. Computer code, as previously described and apparent to one of skill in the art, can be implemented to allocate each multi-state investment among the constituent states depending upon the distribution of amounts otherwise invested and the trader's desired payout distribution.

Example 3.1.22: Emerging Market Currencies  
Corporate and investment...

...rates. When the Federal Reserve (Fed), European Central Bank (ECB) or Bank of Japan (BOJ), for example, changes their target rate or when market participants adjust their expectations about future rate moves, global equity and fixed income financial markets can react quickly and dramatically.

Market participants currently take views on central...

...are commonly represented in matrix form as:

$C$  is the correlation matrix of the underlying events,  
 $w$  is the vector containing the CAR for each active position in the portfolio, and

$w^T$ ) is the transpose of  $W$ . In preferred embodiments,  $C$  is a  $y \times y$  matrix, where  $y$  is the number of active positions in the portfolio, and where the elements of  $C$  are:  
 $c_{ij})=1$  when  $i=j$  i.e., has 1's on the diagonal...

...in state  $i$ ;  $T$  is the sum of all amounts invested across the distribution of states;  $q_i$ ) is the implied probability of the occurrence of state  $i$  derived from  $T$  and  $T_i$ ); and  $r_i$ ) is the return per unit of investment in state  $i$ . In this preferred embodiment, this standard deviation is a function of the amount invested in each state and total amount invested across the distribution of states, and is

also equal to the square root of the unit return for the state. If  $\alpha_i$  is the amount invested in state  $i$ ,  $\sigma_i$  is the standard deviation in units of the amount invested (e.g., dollars) for... the market's "offer" price is to purchasers of the desired quantity. In a preferred embodiment, for each set of quantities invested in the defined states of a group of DBAR contingent claims, a set of bid and offer curves is available as a function of the amount invested.

In the groups of DBAR contingent claims of the present invention, there are no bids or offers per se. The mathematical...

...In the traditional markets, however, there is no ready way to compute such quantities for any given market.

The full liquidity effect -- or liquidity response function -- between two states in a group of DBAR contingent claims can be expressed as functions of the amounts invested in a given state,  $T_i$ ), and amounts invested in the complement states, denoted  $T_c$ )), as follows:

The implied "bid" demand response function shows the effect on the implied state probability of an investment made to hedge an investment of size  $\Delta T_i$ ). The size of the hedge investment in the complement states is proportional to the ratio of investments in the complement states to the amount of investments in the state or states to be hedged, excluding the investment to be hedged (i.e., the third term in the denominator). The implied "offer" demand response function above shows the effect on the implied state probability from an incremental investment of size  $\Delta T_i$ ) in a particular defined state.

In preferred embodiments of systems and methods of the present invention, only the finalized returns for a given trading period are applicable for computing payouts...

...Investment gives the bid side of the market.

In another preferred embodiment, transaction fees are assessed as a percentage of payouts, rather than as a function of invested amounts. Thus, the offer (bid) side of the market for a given digital option could be, for example, (a) the amount invested over the range of states comprising the digital option, (b) plus (minus) the fee (e.g., 10 basis points) multiplied by the total invested for all of the defined states... be seen that, given an amount of premium  $x$  that is desired to be "sold," the complementary investment that must be bought on the complement states in order for the trader to receive the premium  $x$ , should the option "sold" expire out of the money, is a function of the price of the option being "sold." Since the price of the option being "sold" can be expected to vary during the trading period...

... SPECIFICATION includes the information acquisition unit 30, detects the place where the electronic money card 10 is used, the date and time when the electronic money card 10 is used, or the purpose for which the electronic money card 10 is used, and rewrites and records such use status information in the electronic money card 10. Alternatively, the use status information may be registered in the database 72 of the server system 70 in association with card identification information, such as a number and a name recorded in the electronic money card 10.

Use status information is not necessarily a record. A card owner may set in advance the use status of the electronic money card 10.

Presentation status information also indicates at least one of a place where the electronic money card 10 is presented, a date and time when the electronic money card 10 is presented, and a purpose for which the electronic money card 10 is presented. When the electronic money card 10 is presented, the electronic money terminal device 20, which includes the information acquisition unit 30, detects the place where the electronic money card 10 is presented, the date and time when the electronic money card 10 is presented, or the purpose for which the electronic money card 10 is presented. Accordingly, such presentation status information is acquired.

Thus, in this case, the information acquisition unit 30 detects, for example, the place where... money card 10 is reported to the card presenter by using warning display or warning sound, and the electronic money card 10 enters a locked mode so that electronic money stored in the electronic money card 10 is not usable. In addition, a different routine that directly reports to the card owner that the

electronic money card 10 has been found by someone or that...

... SPECIFICATION present invention.

In Fig. 4, the database comprises:

- a job table comprising a job ID and job name,
- a working subject table further comprising a working subject ID and working subject name,
- a storage position table further comprising job ID and job storage location,
- a working state table consisting of the working state of the working subject associated with the working subject ID and job ID, and
- a working state change time table consisting of the working state change time associated with the job ID and working subject ID.

When the working state of the working subject is to be identified, use of a database having such a configuration allows the working state to be identified by accessing this database.

The database which allows the aforementioned factors to be recorded whenever necessary can be used as the database mentioned above. For example, such a recording medium as hard disk can be used, but the database according to the present embodiment is not restricted thereto.

When the job to be administered or...

...table in such a way that, when connection is started, the storage location for the job can be obtained from the job ID by the work administration program to be described below.

The working state and working state change time are recorded as appropriate in the working state table and working...

... with the working subject ID for administration of the working state or working time and with the job ID.

The following describes the aforementioned working state administration program

Such a working state administration program functions as part of the front-end application software program according to the present invention.

Fig. 5 is a flow chart for working state administration

program (1) to be started in response to the request for connection under the work starting instruction. Fig. 6 is a flow chart for the working state administration program (2) to be started in response to the requirements for disconnection under DISCONTINUE instruction. Fig. 7 is a flow chart for the working state administration program (3) to be started in response to the requirements for disconnection under TERMINATE instruction.

When the client user 12a as a working subject having received a work instruction has requested connection under the work start instruction for the job directory 21a (See Fig. 2), the working state administration program (1) shown in Fig. 5 is started and the database is accessed. Then the information at the job storage location is obtained (S1...

... 12a and job directory 21a, as shown in Fig. 2 (S2). The time of connection in S2 is stored in the database (S3) as a work starting time for client user 12a. At the same time, the working state of the client user 12a is set to "Working" (S4), whereby the...

... Connection is then cut off (S5), and the disconnection time of S5 is stored in the database as a work discontinuation time (S6). The working state of the working subject is set to "Discontinued" ("Not Working") (S7), whereby the operation terminates.

If there is a request for connection under the "TERMINATE" instruction in order that the working subject terminates the work, the working state administration program (3) starts as shown in Fig. 7, and connection is cut off (S8). The disconnection time of S8 is stored in the database as work termination time (S9), and the working state of the working subject is set to "Work Terminated" (or "Not Working") (S10). Then working time is added up from the work starting time, work discontinuation time and work termination time certified in S3, S6 and S9 (S11). This added time is set as the total working time of the client user 12a as a working subject.

As described above, when the working subject is changed to the connected state under the work start instruction for the job directory 21a by the working subject, the working state of the working subject is recorded as "Working" in the aforementioned database. When the aforementioned connection is cut off under the instruction of the work by the aforementioned working subject, the working state of the working subject is recorded as "Discontinued" in the aforementioned database. When the aforementioned connection state is cut off under the work termination instruction by the aforementioned working subject, the working state of the working subject is recorded as "Terminated" in the aforementioned database. This allows the working state to be administered merely by accessing the database in such a way as to show whether the client user as a working subject is in the "Working", "Discontinued" or "Terminated" state.

The cumulative working time can be calculated as follows: When the database is in the state shown in Fig. 4 for example, the working time for the job having the job ID of "1" is five minutes from 11:20 to 11:25 in the case of the working...

... recorded in the database as work starting time; the time of cutting off the connection under the "Discontinued" instruction is recorded in the database as work discontinuation time; and the time when the connection is cut off under the termination instruction is recorded in the database as work termination time. The time when this working state is changed is used to calculate the working time for this job regarding the working subject, and this working time is stored in the database, whereby the working time of the working subject can be administered.

As described above, various types of information is stored in the

database in real time. This allows the working state of the working subject in real time to be administered by accessing the database and ascertaining the working state of the working subject.

In the same way, if connection state of client user 12b is as shown in Fig. 3, then the job directory 21b can be determined as being in a working state. If it is disconnected as shown in Fig. 2, the state can be evaluated as being "Not Working", whereby it is possible to determine whether client user 12b is working or not.

If the working subject table representing the working subject name and working subject ID in the aforementioned embodiment consists of the working subject ID associated with the working subject name and client terminal, then the same working subject can be administered separately for each client terminal.

Figs. 8 and 9 are illustrations representing a second embodiment of the working state and job state administration system according to the present invention. In Figs. 8 and 9, the same reference numerals with those of Fig. 2 denote the same configurations.

According to the present embodiment, the working state is administered for each front-end application software. A working directory is provided in conformity to the front-end application software as a working subject and the job directory as a working object.

In the state shown in Fig. 8, connection by the front-end application software 11a is not yet established, the working state of the front-end application software 11a is evaluated as "Not Working" ("Discontinued" or "Terminated"). This is stored in the database.

The client user 12 uses the front-end application software 11b to make a direct connection between the working directory 30b usable only in the state of connection by the front-end application software 11b and the job directory 21b for storing job-related files, whereby the front-end application software 11b is placed in the connection state, with the result that the working state of the front-end application software 11b for the job directory 21b is stored in the database as "Working".

In the state shown in Fig. 9 on the other hand, the client user 12 uses the front-end application software 11a to make a direct connection between the working directory 30a usable only in the state of connection by the front-end application software 11a and the job directory 21a for storing the job-related files, whereby the front-end application software 11a is placed in the state of connection, with the result that the working state for the job directory 21a is evaluated as "Working" and is stored in the database. In this case, connection by the front-end application software 11b is not yet established. The working state of the front-end application software 11a is evaluated as "Not Working" ("Discontinued" or "Terminated"), and the result is stored in the database.

As described above, the working state is determined for each front-end application software, and is stored in the database, whereby the working state for each front-end can be administered.

Figs. 10 and 11 are illustrations representing a second and third embodiments of the working state administration system according to the present invention. In Figs. 10 and 11, the same reference numerals with those of Fig. 2 denote the same configurations. ... the external client application software 13b is not connected, the working state of the external client application software 13b is stored in the database as "Not Working" ("Discontinued" or "Terminated").

In the state shown in Fig. 11, on the other ... external client application software 13a is not connected; therefore, the working state

of the external client application software 13a is stored in the database as "Not Working" ("Discontinued" or "Terminated").

The external client application software 13b uses the front-end application software 11b to make a direct connection between the working directory...

...with the job directory 21b; therefore, the working state of the client terminal 10b for the job directory 21b is stored in the database as "Not Working" ("Discontinued" or "Terminated").

In the state shown in Fig. 13, on the other hand, the client terminal 10a is not connected with the job directory...

... SPECIFICATION to determine the path back to the host. Any host program accessing the DASD could send the header described above to uniquely define the DASD actuator to access.

Fig. 2 shows the basic elements of one data storage sub-system of the embodiment, which, although similar to that shown in Fig. 1, is shown in a very generalised block form. The assumption that has been made in Fig. 2, is that the maximum possible integers are physically connected and working. It must be remembered that the invention is intended to deal with circumstances in which this becomes progressively untrue so that there will be times in the following discussion when, for example, it will appear that only two HDA's are connected, despite what is shown in Fig. 2. It is...

... functions. The dual copy function provides enhanced data availability and reliability by maintaining two identical copies, a primary copy and a secondary copy, of volumes, called a duplex pair, on two physically separated DASD units, for example, a primary data storage device in string 70 and a secondary data storage device in...

... and the attached data storage devices. In the example, this consists of the single controller 125 and the two data storage devices 70 and 75.

Status information about the subsystem is retained across power downs by writing a single record of status and

identification information twice on the status track of each device.  
Global subsystem status is also kept on the...

...but global subsystem status is only kept on the two global data storage devices. The global subsystem status portion of the record is formatted but not used if the device is not one of the two global subsystem status devices.

... SPECIFICATION If all nodes and links in the end-to-end route are active, the ROUTE-SETUP will be successful and an end-to-end route will be created.

Each routing table entry in each node traversed is marked as operative. If a node cannot forward the ROUTE-SETUP message to the next...

... a ROUTE FAILURE message identifying the inoperative link or node is generated and returned to the route origin for forwarding to the topology data base. The inoperative status is marked in the topology data base and that network element is not used in subsequent ROUTE-SETUP messages until its status changes.

As the ROUTE FAILURE message returns through each node identified in the ROUTE-SETUP, each node's routing table entry remains intact, with the ...

... becomes operative, the node routing table entries are used by ROUTE ELEMENT OPERATIVE messages (one in each direction around the point of failure) to follow the route back to the end node for forwarding to the topology data base(s) to indicate the operative status of the network element.

In either case, as the ROUTE ELEMENT OPERATIVE messages flow to the topology data base(s), the routing table entries are removed from the nodes along the route to recover the routing table space just as if the end-to-end route were being normally deleted after the termination of all sessions using the route.

The feedback mechanism functions in the face of both single point and multiple point failures along the route, as described in greater detail below.

The basic elements of the feedback mechanism of the preferred embodiment can be described by a set of rules, definitions, states and protocols which may be applied to any communication network having dynamic routing of the type herein described. The protocols are described in four operational cases.

#### RULES OF OPERATION, DEFINITIONS & STATES

1. Topology Data Base. There will exist one or more topology data bases which contain network node, connectivity and status data which can be used to select an end-to-end route through a communication network.

For each route element (that is, for each network...

... processor; and for each link, which can be either teleprocessing link, channel connection, local teleprocessing loop, Local Area Network, fibre optic line, or any other medium which can connect two host or communication processor nodes), there exists a set of parameters as follows: (see image in original document) These characteristics are well known in the art.

Various methods can be utilised to create the entries and element knowledge in the topology data base. They include operator input, a system...

DEPENDENCE OF MEDIUM RANGE FORECAST ERROR ON PATTERNS IN THE INITIAL STATE (OROGRAPHIC FEATURES, STORM TRACKS, BAROCLINIC ZONES)

A study of the once daily (0000 UTC) 1000 mb error fields of the National Meteorological Center's 80-wave Medium Range Forecast (MRF) model are presented. Time and space mean error fields over integration length and period of record are diagnosed. A reduction in the...

...stream region and United States-Canadian border) and persistent atmospheric features (Hudson Bay low, eastern Pacific subtropical high and Desert Southwest heat low).

This historical data base of 80-wave MRF model integrations is used to determine if different initial states produce distinctly different model forecast errors. Teleconnection indices defined by the 500 mb height field are used to identify patterns in the initial state of individual model integrations. The mean error patterns in the 80-wave MRF are significantly different at day-7 and day-10 using the Western...

THE DEVELOPMENT AND TESTING OF A STANDARDIZED PROTOCOL FOR ANALYZING THE WASTE STREAM (SOLID WASTE, COMPOST)

Author: MARTIN, JOHN HANNON
Degree: ED.D.
Year: 1993
Corporate Source/Institution: WEST VIRGINIA UNIVERSITY (0256)
Source: VOLUME 54/11-B OF DISSERTATION ABSTRACTS INTERNATIONAL
PAGE 5591. 86 PAGES

...recycled, or composted: plant debris, putrescibles, paper, metals, glass, textiles, chemicals, wood, soil, rock, reusables, plastics, and other. The information was then entered into a data base for statistical analysis to determine a sampling size for three levels of confidence (80, 90, 95) and two errors (1% and 2%). This formed the...

...of a written protocol for analyzing the waste stream

This protocol was tested at a county sanitary landfill (5000 tons/month). Net load weight of vehicles with relatively pure loads of each of the categories were recorded. Randomly selected samples of mixed solid waste were separated into the thirteen categories. Each category was weighed and recorded.

The result was presented in the following formats: (1) percentage by category; pure loads, mixed waste, combined total; (2) percentage by source; residential, institutional, commercial, industrial; (3) percentage by count, transportation modes; (4) percentage by weight, transportation modes; (5) an hourly vehicle count.

This study recommends that 45-200 lb. samples randomly collected will validly reflect (95% confidence level, 2% error) the composition of a given solid...

CAPACITY ANALYSIS OF MULTI HOP PACKET RADIO NETWORKS UNDER A GENERAL CLASS
OF CHANNEL ACCESS PROTOCOLS AND CAPTURE MODES

Author: BRAZILQ, JOSE MANUEL REGO LOURENCO

Degree: PH. D.

Year: 1986

Corporate Source/Institution: STANFORD UNIVERSITY (0212)

Source: VOLUME 47/06-B OF DISSERTATION ABSTRACTS INTERNATIONAL.

PAGE 2554. 294 PAGES

CAPACITY ANALYSIS OF MULTI HOP PACKET RADIO NETWORKS UNDER A GENERAL CLASS
OF CHANNEL ACCESS PROTOCOLS AND CAPTURE MODES

...are within hearing range of each other, and thus multihop operation is required. These networks represent the natural extension of point-to-point packet-switched data networks when mobile operation is desired. An important difference exists, however, with respect to the latter: due to the multiaccess nature of the radio channel, the...

...as the type of signaling and received power levels. The conditions under which a packet is successfully received in the presence of interfering packets are designated as the capture mode. Due to the existence of multiuser interference, some form of coordination among the users is required when accessing the channel. This purpose is accomplished by...

...problem of the capacity analysis of a multihop packet radio network; namely, given a network specified by its topology, traffic pattern, channel access protocol, and capture mode, finding the maximum feasible link traffics compatible with the given traffic pattern. In this thesis we start by examining the capture behavior obtained from different...

...protocols in a general class that includes some of the main protocols of interest for packet radio applications. Examples of protocols in this class are Carrier Sense Multiple Access (CSMA), Busy Tone protocols, Disciplined-ALOHA, and ALOHA. From this model we derive throughput measures, and develop algorithms for finding the network...

Abstract: ...finite state machine. The operational procedure construct captures the embedded operational behavior of the system over all the missions in the life-cycle. The finite state machine captures the reactive behavior of the system. The model, captured in a data-base and interrogated through a graphical user-interface, can be used for simulation, analysis, and the generation of code and documentation.

Descriptors: aircraft computers; aircraft control; aircraft displays; aircraft landing guidance; aircraft navigation; computer aided software engineering; entity-relationship modelling; finite state machines; flowcharting; formal specification; object-oriented methods; real-time systems; systems analysis

Abstract: Sirsi Corporation has developed a CD-ROM interface for its integrated library system that provides access to MARC databases now available in that format. The MARC databases can be used in either an online or interactive mode. In the online mode, a host computer directly accesses the CD-ROM via a microcomputer. In the interactive mode, a staff member selects records from the CD-ROM and uploads them to a host computer.

Identifiers: Sirsi Lasertap; inhouse library system; CD-ROM interface; integrated library system; MARC databases

...medical electronics laboratory can be reduced with the implementation of a good recordkeeping system. One such orderly process includes a work order form, a device record card, and a status indication form. With consistent use, this system has met with success. It is anticipated that, with further development, the system can grow into a solid data base.

...2+) \$ uptake, measured simultaneously with dopamine release, was
increased by 7 and 10% respectively. Neither Ca^{2+} uptake
nor dopamine release was altered under non-depolarizing
conditions (5 mM KCl). The time course of the TPA effect,
 Ca^{2+} uptake and dopamine release was measured after 1, 3, 5
...

... was different from control. To determine the extracellular calcium
dependency of the TPA-induced increase in dopamine release, experiments
were performed in calcium-free incubation medium containing EGTA.
Replacing extracellular calcium with 100 μM EGTA caused a 53% reduction
in Ca^{2+} -stimulated (60 sec) endogenous dopamine release and decreased
(Ca^{2+}) i to 120 nM. TPA (1.6 μM) increased Ca^{2+} -stimulated
dopamine release by 25%. In calcium-free medium, 30 mM KCl did not
stimulate an increase in the (Ca^{2+}) i. TPA (1.6 μM) did not
alter the (Ca^{2+}) i under resting or depolarizing conditions. The
inactive 4 α -phorbol had no effect under any of the above
experimental conditions. These observations indicate that in
striatal synaptosomes, protein kinase C activation does not affect
calcium uptake through voltage-sensitive calcium channels. The

ABSTRACT: Extracts obtained from mouse cells growth arrested at stationary phase
or under serum starvation exhibit no specific rDNA transcription
activity. Experiments with mixed transcriptionally active and inactive
whole cell extracts (WCE) obtained from rapidly dividing or growth
arrested cells, respectively, demonstrate that rRNA synthesis in vitro
can be suppressed by a polymerase I transcription inhibitory activity
(PIN), present in inactive extracts. This inhibition effect is not
related to increased nuclease activity and affects neither the non-
specific Pol I transcription, nor a polymerase II promoter. A comparison
of WCE isolated under different growth conditions indicates that PIN

changes according to the physiological state of the cell. It reaches a maximal level soon after serum depletion and disappears rapidly when cells are allowed to recover in serum-rich medium. PIN can be clearly demonstrated in VCE but not in nuclear or cytoplasmic extracts and can be also obtained by an additional high salt extraction of nuclei. Furthermore, gel retardation and transcription-in-pellet assays demonstrate that rDNA promoter binding and preinitiation complex stability are similar in active and inactive VCE. This indicates that some later stage(s) of rDNA transcription, rather than the preinitiation complex formation, are attenuated by inactive extracts. Analysis of partially fractionated extracts suggests that PIN is not associated with but can be separated from polymerase I.

...ABSTRACT: of substrate disintegrated for 10 min at 25° C in the presence of chlorides and nitrates. The salts were introduced directly to the incubation medium or were added to the extracting phosphate buffer having pH 7.2, with which the samples remained for one day and then chlorophyllase was fractionated by filtration into soluble and insoluble. In both cases the activating concentrations were 0.05-0.1 or 0.05-0.2 M while 0.5 M was the inhibiting concentration, but no specificity of individual ion effect was observed. It is assumed that chlorophyllase activity is determined by the ion strength of the medium which changes its molecule hydration. The sum total activity of soluble and insoluble chlorophyllase was higher compared to that of the starting preparation, which indicates that ions contribute for the disruption of intermolecular ties in the complexes and for deblocking an inactive enzyme. Chloride and nitrate anions had an activating effect on soluble chlorophyllase. In small quantities they eliminated the inhibiting effect of high ion strength in the medium and ensured the manifestation of 2 maxima in the enzyme activity, at 0.1 and 0.5 M. The 1st one depends more on NO₃⁻ while the 2nd depends on Cl⁻. It is assumed that chlorophyllase aggregation is changed under the specific conditions existing in the medium.

... power management has led to the development of hardware devices with low-level power management support. I/O devices like hard disks and wireless network cards support non-operational low power modes that can save energy during periods of inactivity. Unfortunately, several workloads lead to access patterns that low-power modes cannot exploit for power efficiency. This dissertation proposes high-level I/O access pattern reshaping for power...

...O burstiness and exploiting hardware concurrency.

Bursty access patterns increase opportunities for power management by increasing the length of periods during which a device remains inactive. The dissertation proposes a set of prefetching and caching enhancements that lead to a significant increase in idle interval lengths. The proposed enhancements have been implemented in the Linux operating system and evaluated experimentally. They lead to disk energy savings of up to 80% and wireless network card energy savings of up to 30% with little or no reduction in throughput or interactive responsiveness. The dissertation also presents and validates a generic model...

...improve power efficiency. One can exploit the performance benefit achieved through hardware parallelism to reduce the power consumption of server-class disk arrays. Based on state of the art disk specifications, one could replace each server-class disk with a mirrored disk array of three power-efficient laptop-class disks. A new scheduling policy for disk array I/O requests can then exploit the variability of server workloads by diverting accesses to a small subset of the disks during periods of low or moderate load, allowing disks that represent excess capacity to power...

ABSTRACT: The aggregation of the alpha/beta protein acylphosphatase from *Sulfolobus solfataricus* has been studied under conditions in which the protein maintains a native-like, although destabilised, conformation and that therefore bear resemblance to a physiological medium. Static and dynamic light-scattering measurements indicate that under these conditions the protein aggregates rapidly, within two minutes. The initial aggregates are enzymatically active and have a secondary structure that is not yet characterized by the high content of cross-beta structure typical of amyloid, as inferred from Fourier transform infrared and circular dichroism measurements. These species then convert slowly into enzymatically inactive aggregates that bind thioflavin T and Congo red, characteristic of amyloid structures, and contain extensive beta-sheet structure. Transmission electron microscopy reveals the presence in...

...dissolution and re-nucleation of the aggregates. Formation of thioflavin T-binding and beta-structured aggregates is substantially more rapid than unfolding of the native state, indicating that the initial aggregation process promotes formation of amyloid structures. Taken together, these findings suggest a mechanism of amyloid formation that may have physiological relevance...

Voltage-activated ionic currents in goldfish pituitary cells

...ABSTRACT: recordings suggested that all goldfish pituitary cells possess voltage-dependent Na⁺, Ca²⁺, and K⁺ currents. These currents were further characterized independently under isolated current recording conditions. The rapid, transient Na⁺ current activated at voltages more positive than -40 mV and was sensitive to tetrodotoxin. The steady state inactivation of this Na⁺ current was also voltage-dependent; at the measured resting potential, about 50% of the Na⁺ current was not available for activation. The voltage-dependence and activation kinetics of the tetraethylammonium-sensitive K⁺ current resembled those of the delayed rectifier K⁺ current. The K⁺ current activated slowly at potentials more positive than -40 mV, and showed little inactivation over the duration of a 1-sec depolarizing pulse. Steady-state inactivation characteristics indicated that about 50% of the K⁺ current was inactivated at resting potentials. Experiments with 4-aminopyridine indicated the presence of an early transient K⁺ current that activated in a similar voltage range as the delayed rectifier current. Using barium as the charge carrier to measure Ca²⁺ currents, a high-voltage activated, long-lasting Ca²⁺ current was revealed. This "L-type" Ca²⁺ current activated at potentials more positive than -30 mV and was inhibited by verapamil and nifedipine. This study indicates that goldfish pituitary cells possess the electrophysiological properties...

 DI SCLOSING DISCIPLINED DOCTORS JUDGE SAYS STATE MEDICAL BOARD MUST EXPAND  
 POLICY FOR CONSUMERS  
 San Jose Mercury News (SJ) - Thursday, September 15, 1994  
 By: Mercury News Staff Report  
 Edition: Morning Final Section: California News Page: 3B  
 Word Count: 232

The newspapers sought to obtain the board's entire computer data base of an estimated 3,000 doctors who have been disciplined.

Warren's oral ruling determined that the board's disclosure policy was selective and violated the state public records act, said attorney Judy Alexander, who represented the newspapers.

The board had argued that to provide the data base to the media, the state would have to spend thousands of dollars and 216 hours to have special software prepared. But a court-appointed computer expert determined that...

TECHNOSIS: TECHNOSIS, INC. ANNOUNCES THE AVAILABILITY OF SEQUELIN 3.0(TM)

August 21, 1995

Byline: Business Editors

...functionality available from each of the servers it communicates with. The database server can now be queried as to what functionality is available from the database at run time. Truly open applications can now be developed with this unique technology.

This functionality has been made possible with the addition of a new general API call known as SQProvide. As an example, client application source code when executing a database might take advantage of that database's stored procedure functionality. The same source code would not even attempt to request stored procedure functionality from another database.

#### Streamlining BLOB Support

Binary large objects (BLOB) are application specific types such as images, sound, formatted and multi-media movies. Applications can now request BLOBs in fetch (streamlining) mode without having to pre-allocate memory within the application space. The BLOB size is limited only by the maximum size of DBMS. This functionality provides the most practical method for an application to handle large binary data types.

#### Apple Macintosh ODBC Support

SequeLink provides full connectivity to ODBC-compliant Apple Macintosh applications. Consistent high performance access across enterprise networks and databases is made available with a single driver for the first time to Macintosh ODBC clients.

#### Windows NT Server Support

SequeLink provides support for Windows NT as a database server platform. Initial database support includes Microsoft-SQL Server and Oracle via TCP/IP.

#### Systems Requirements

SequeLink supports leading client and server environments including, MS Windows, Windows NT, UNIX...

3M TRAFFIC & SAFETY 2: 3M™ Intelligent Fleet Operations System A turn-key solution to increase transit ridership and cut costs

March 29, 1995

Byline: Business Editors & Transportation Writers

...At the Transit Center  
The 3M INFO System provides transit managers a user-friendly set of tools designed to provide a constant picture of the active fleet. It reports exceptions -- those individual vehicles not running on plan -- and also allows the transit managers to request the status of any specific vehicle.

In addition, the system's database generates accurate, useful summary reports. This information helps transit managers plan better routes, assign drivers more productively, improve service throughout the system and lower operating...

MATRIX: MATRIX ASIA JOINS JI TONG AND MOTOROLA IN DEAL TO SET UP WIRELESS DATA NETWORK IN CHINA

February 16, 1995

Byline: Business Editors

...Asia, a unit of Matrix Telecommunications Ltd. (MFL) (NASDAQ: MFLTY), a leading Australian paging, messaging and telecommunications provider, today announced that it has agreed to work with China's Ji Tong Communications Ltd. and Motorola of the US to set up a wireless data network in China.

Ji Tong is a state owned company established in 1993 with the explicit task of improving China's data communications network, Matrix said. The Chinese State Council assigned Ji Tong the task of developing three "Golden Projects," including Golden Bridge, a national information network of stored and real time data, Golden Card, a bank credit payment and authentication network, and Golden Customs, a network that connects all customs offices.

Matrix said the demand for wireless data communications...

BANYAN SYSTEMS: Banyan Systems announces BeyondWare architecture for extending functionality of enterprise messaging

November 30, 1994

Byline: Business Editors & Computer Writers

...enables applications to be tightly integrated with BeyondMail. The degree of integration can range anywhere from user interface coupling to direct connections with the proprietary database formats of third-party applications.

At the infrastructure level, BeyondWare solutions take advantage of the underlying message transport, message store and directory services of Banyan...

...simplifying use and administration, minimizing overhead and increasing the return on investment of the messaging network. BeyondWare Partners

Through BeyondWare, Banyan has identified seven strategic categories of applications whose integration with messaging delivers unique solutions. These categories are calendaring/scheduling, collaboration, database access, document imaging, forms routing and workflow, and document management.

To provide customers with the best solutions in each of these categories, Banyan has established partnerships with strategic third-party vendors, VARs and systems integrators whose products represent leading-edge technology or whose services and integration expertise...

...in the County of San Bernardino," said David Horwatt, vice president of sales for General Networks, a Banyan/BeyondMail reseller.

"BeyondMail has been the key vehicle for adding workflow

to document management solutions, as well integrating CalANdAr to manage the scheduling of people and tasks."

A selection of the BeyondWare categories includes:

Database Access: In this BeyondWare category, Banyan has delivered a solution through BeyondMail. BeyondMail can be used as an email-based database front end, allowing administrators to provide their users with direct and efficient access to corporate databases.

Users simply interact with custom BeyondMail forms to query or update the database, giving them the ability to manage all of their information from within a robust electronic mail environment. Administrators also benefit from the reduced number of simultaneous connections to the database server, reduced desktop networking complexity, and the ability to implement database access without training users.

Additionally, a new native ODBC extension to the Beyond rules technology is now available, free of charge, as a BeyondMail Add...

FUTURE OF AUTOMOBILE TRAVEL UNVEILED IN ORLANDO

DATE: March 24, 1992 10:33 EST WORD COUNT: 563

, March 24 /PRNewswire/ -- TravTek, a one-year test of the nation's most advanced intelligent vehicle/highway system will begin Wednesday in Orlando, Fla., as motorists drive specially equipped cars onto the most extensive network of "smart" roads and highways in the United States.

At a news conference announcing tomorrow's start of the \$12 million project, U.S. Secretary of Transportation Andrew Card congratulated Orlando Mayor Bill Frederick, Florida Secretary of Transportation Ben G. Wills, American Automobile Association President Paul R. Verkuil and General Motors Research and Environmental Staff Vice President Robert A. Frosch for working with the Federal Highway Administration to jointly develop TravTek.

"TravTek -- short for Travel Technology -- instantly provides drivers with access to video map displays; audio and visual driving directions; current traffic conditions; emergency assistance; and information about hotels, restaurants, local attractions and special events," Card said.

"The system is a much needed exploration of technologies that can... and other sources of traffic information. Satellite technology, magnetic compasses and wheel sensors are used to pinpoint the car's location on a navigable map data base provided by AAA.

Information is processed by micro-computers developed by General Motors for this project and is displayed on a color video monitor in...

 Hot database backups on UNIX  
 Jones, Earl  
 UNIX Review v13n12 PP: 45-53 Nov 1995  
 ISSN: 0742-3136 JRNL CODE: UXR  
 WORD COUNT: 4476

...TEXT: backup media and the information that is on that media becomes critical. Hot backup enables the DBA to recover only the corrupt portions of the database. Therefore, the ability to locate the appropriate backup media and the data's location on the tape quickly is very important to reduce recovery times.

When performing a hot backup, it is impractical to place the entire database into backup mode. If this is attempted, the transaction logs will grow at an accelerated pace and can exceed the ability of the UNIX file system to store them. With the increasing size of RDBMS implementations, develop a process to place portions of the database into backup mode, back them up, capture the redo logs associated with the backup, and then move on to the next area of the RDBMS. When considering how to segment the database into logical components for backup, consider the type of information as well as related information that can be grouped together easily. This smoothes the recovery...

...backup refers to the process of reading the physical storage mechanism used by the database (raw partitions or UNIX files) and copying them to backup media, usually tape. If the RDBMS in use supports the process of doing a physical hot backup (Oracle, for example), several steps need to occur. The first step is to place the designated tablespace into backup mode. When this happens, updates that are directed to that tablespace are placed in transaction logs. After the tablespace has been successfully placed into backup mode, the physical structure is copied to the backup media. After the backup, the tablespace is taken out of backup mode, and the updates waiting in the transaction logs are applied to the tables.

Not all RDBMS allow this method of executing a physical hot backup of the underlying...

...backup employs the utilities supplied by the RDBMS vendor and involves exporting information from the RDBMS tables. These procedures are known as export and import functions. When doing logical hot backups of the database, similar steps are performed as with physical hot backups. The tablespace is placed into backup mode, the data is exported to the backup media, the tablespace is taken out of backup mode, and a refresh from the transaction logs occurs.

Several reasons can be given for utilizing both the...

How to use (and choose) the right Windows contact manager

O Flaherty, Tom

Telemarketing Magazine v12n12 PP: 46-47+ Jun 1994

ISSN: 0730-6156 JRNL CODE: TLM

WORD COUNT: 3168

...TEXT: contact manager should also allow an unlimited number of user-defined fields to be attached to any of those records. Telemarketing can thus track table categories, such as the company's industry, contact/individual function and position, and level of interest in a particular product. Listed under these categories would be specific values or "items," such as (for industry): plastics distribution, oil exploration or refining, computer hardware; or (for position/function): manager, industrial sales; engineer, oil drilling; vice president, product development.

This indexed, relational, two-tier category/items approach offers definite advantages in terms of increased functionality and flexibility. You're not forced to rigidly describe all the data for all prospects in a highly structured manner, whether or not you need...  
...can add an unlimited number of items, such as "screws," "nuts," "bolts," "nails" and "washers" to a prospect's record.

Since they're relational, any changes or deletions of these categories and items will ripple throughout your database, updating all records. You can also define an unlimited number of indexed user fields by including as many...

...1," and so on, to cover all product information you send out by mail, courier or fax.

#### ENTERING THE DATA INTO THE CONTACT MANAGER

Once categories have been assigned, you must next move the information on telemarketing target prospects--organizations, individual names, addresses, telephone and fax numbers--into your contact manager. Is this contact information in "hard copy" (boxes of returned "bingo" card leads from display ads or direct mail); existing customers already part of an electronic database; a purchased list either on paper, database on diskettes or on CD-ROM or any combination of these? The format affects how the information will be "imported" into the contact manager.  
Importing call prospects--the telemarketing database--should be done by trained data-entry clerks, transposing the paper information into the contact manager's electronic company/contacts ...paper-to-PC keying chore with predefined data-entry tables.

For example, instead of typing in people's titles, salutations, names of cities, countries or state abbreviations, when in that record's areas (or "fields"), hitting a key pops up an alphabetical list of possible entries--the chosen entry is automatically inserted by a simple mouse...

...key.

A good contact manager should also have a good "import/export" function to easily move data already in electronic form (for example, from a database program or purchased on diskettes) into and out of itself. At a minimum you should be able to import that data in industry-standard ASCII...

...TEXT: expansive amount of information, more and more of which is in electronic form. The State Archives and Records Administration (SARA) operates programs to insure that state and local government records remain usable and accessible as long as they are needed.

SARA has two major programs for addressing electronic records management

issues...

...executive branch agencies of New York State government. The Local Government Records program works with the 4,000 units of local government throughout the state.

#### STATE GOVERNMENT RECORDS

In 1985 SARA secured funding from the state legislature to explore the implications of what was called "special media records," including computer-generated electronic records, for the state's archival records program. Using a fairly traditional approach to identify the extent of information in electronic form and analyze the issues associated with access to and preservation of electronic records, the Special Media Records Project identified more than 1000 automated information systems and analyzed several of these systems in depth.

Through the project, SARA learned that most state agencies maintain several large administrative database systems. Examples include the Computerized Criminal History System which maintains criminal histories on thousands of individuals; the Basic Educational Data System which collects demographic and financial data from New York's public and private schools; and the Vital Records System which maintains information on vital life...

...the day-to-day work of the agencies they serve, but they also contain some of the most valuable statistical information created or collected by state government.

The published findings of the Special Media Records Project, A Strategic Plan for Managing and Preserving Electronic Records in New York State Government, articulated a program development framework for SARA to foster sound management and selective preservation of state government's electronic records. The plan identified the techniques and resources needed to address electronic records management and proposed to integrate these techniques and resources...

...systems, complementing the existing archival program for paper, microfilm and audio-visual records. SARA has accessioned and made available a variety of data sets.

Electronic records produced by state agencies are created to serve program needs. Often, these records are not in a standard format and are not designed with long-term preservation or secondary use in mind. SARA faces the challenges of preserving records stored in relational databases, local area networks, digital imaging systems and virtually any other information storage and retrieval configuration available. SARA's long-range goal is to develop services...

...the requirements for its use are and what restrictions or protection are afforded to the data.

To meet this challenge, SARA and the New York State Library are leading an effort to establish an information locator system for state government information, building on work previously done for health and mental health programs by the New York State Forum for Information Resource Management.

In 1992 SARA received funding from the National Historical Publication and Records Commission for the "Building Partnerships Project," a two... data on policies and approaches used by agencies to manage electronic records and identify model or exemplary policies and methods that have been implemented in state agencies.

Although much of SARA's work focuses on meeting specific agency needs, the organization is also involved in activities that address broader

issues for electronic records in all state agencies. SARA advocates the development of government information policies on such issues as access, dissemination and privacy protection in ways that support the records and...

...TEXT: characters long) to pop into the field, select the Table category.

Maximizer's records are fully editable, with one exception--once you've set a category type, you can change its name but not its type.

You can attach an unlimited number of notes to each Maximizer record, although each note is limited to 9...

...you search by category. Then you can enter multiple categories as search terms and instruct the program to gather either records that contain all the specified categories or records that contain at least one of the specified categories.

Thus, performing complex searches involving multiple terms requires you to perform sequential searches, progressively narrowing the resulting list as you go. In addition, certain types of nested arguments cannot be performed at all. Finally, you are restricted to searching the database field by field--there is no global search. We rate searching capabilities good.

Scheduling and telephone: Maximizer's scheduler is complete, though it is clearly...generally quite easy to learn due to the streamlined simplicity of its design, hard-copy tutorials (found in the quick-start guide), and the sample database. However, there are a few problems. For example, if you try to search on the Company field in a list of individual clients, you won...

...to use that field in your search. In addition, it would be helpful if there were better on-screen cues. The procedure to attach a record to a category is unintuitive. For example, you highlight a record, then select the Category icon (a hand holding index cards), and then press Insert to add a category to that record. There are no on-screen cues to tell you those are the steps you need to perform and new users will need to consult the manual.

The program would be easier to learn if there were a status line to inform users about a button's functions. Despite these problems, Maximizer can be learned by most users in only a few hours. We rate ease of learning good.

...TEXT: the public on the advantages of the system. Using Idaho's video studio resources and talent, the tape focused on the advantages of a shared data base.

By September 1988, NEC Information Systems Inc. had been selected to provide equipment. By June 1989, Idaho, Nevada, Oregon, Utah, and Wyoming had obtained funding to oversee vendor operations, and ensure that contractual requirements were met.

The WN host computer was installed in Sacramento, CA, and 900,000 print records from five states were converted to AFIS data and loaded into the system. Remote subsystems were installed in Boise, ID; Carson City, NV; Cheyenne, WY; Portland, OR; Salem, OR; and Salt Lake City, UT. Booking terminals are slated to be installed in numerous locations throughout these states. Alaska, California, and Washington systems are currently being connected to the WN system.

The WN AFIS, now fully operational, is capable of processing 24,240 arrest cards and 4,500 crime scene latent prints a month against an available data base of 8.2 million criminal fingerprint records. With the pooling of data from individual states, contiguous states' records can also be searched as necessary. Since crime knows no borders, the probability of hits increases greatly.

During the first eight months of operation, WN...

...the WN system. First, as mentioned above, by searching the print files of other states, individuals who are in the habit of operating in adjacent states are being identified. Criminals move from state to state so that if they are caught, they can use an alias and try to get off as a first offender. WN now allows...

...are equally promising. In Nevada, the gaming industry is highly interested in being able to identify applicants who are using an alias on their applicant cards. The ability to match prints and gain a more accurate identification is useful for this business. The gold mining and processing industry is also interested...

... backup media and the information that is on that media becomes critical. Hot backup enables the DBA to recover only the corrupt portions of the database. Therefore, the ability to locate the appropriate backup media and the data's location on the tape quickly is very important to reduce recovery times.

When performing a hot backup, it is impractical to place the entire database into backup mode. If this is attempted, the transaction logs will grow at an accelerated pace and can exceed the ability of the UNIX file system to store them. With the increasing size of RDBMS implementations, develop a process to place portions of the database into backup mode, back them up, capture the redo logs associated with the backup, and then move on to the next area of the RDBMS. When considering how to segment the database into logical components for backup, consider the type of information as well as related information that can be grouped together easily. This smoothes the recovery...

... backup refers to the process of reading the physical storage mechanism used by the database (raw partitions or UNIX files) and copying them to backup media, usually tape. If the RDBMS in use supports the process of doing a physical hot backup (Oracle, for example), several steps need to occur. The first step is to place the designated tablespace into backup mode. When this happens, updates that are directed to that tablespace are placed in transaction logs. After the tablespace has been successfully placed into backup mode, the physical structure is copied to the backup media. After the backup, the tablespace is taken out of backup mode, and the updates waiting in the transaction logs are applied to the tables.

Not all RDBMSs allow this method of executing a physical hot backup of the underlying...

... backup employs the utilities supplied by the RDBMS vendor and involves exporting information from the RDBMS tables. These procedures are known as export and import functions.

When doing logical hot backups of the database, similar steps are performed as with physical hot backups. The tablespace is placed into backup mode, the data is exported to the backup media, the tablespace is taken out of backup mode, and a refresh from the transaction logs occurs.

Several reasons can be given for utilizing both the...

... that's dynamically resized in version 1.5 according to the length of the typed-in text) in which the user can place examples to specify selection conditions. The user can also specify links between files.

When building conditions, QBE supports dBASE functions and relational and comparison operators (for instance, OR, +, -, =, AVG, SUM, etc.). Pattern and soundex searches (LIKE..., SOUNDS LIKE...) and wild cards (LIKE "NEW") are also supported. Query operators (such as Update, Group By, Every, First, etc.) can be used to specify file-wide operations and conditions. Each field can have more than one assigned condition or link, with various operators mixed and matched with great flexibility. Files can be linked and cross linked as long as there's no circular...

...by another user may or may not be reflected in the query depending on when the update is performed. Therefore, no exclusive use of the database file is required. However, if the index tag specified in the query doesn't exist at runtime, the file must be used exclusively while creating the index. A query will fail if the database file being queried is in exclusive use by another user.

The QBE in version 1.1 (and earlier) used the SET FILTER TO command to limit the scope of processed records. Of course, since SET FILTER is inherently slow (each record is compared to the condition), processing queries on big files was unacceptably slow. Version 1.5 added the same optimizing techniques found in the new extensions to the dBASE language...

...from session to session.

One special form of the dBASE query is an "Update Query" in which all (or a subset) of the data is changed based on specified conditions and ranges. The update query can replace data, append data, delete records, and undelete records. These operations are possible even on queries that include more than one file (but...

... written in Recital code and can be modified.

The Assistant screen displays a menu bar online one of the display. Lines two through 22 display database and other information. The status bar on line 23 provides information such as the current command in use, currently selected file, update/query mode selected and record position. Commands relating to menu operation are shown directly above the status bar. The line below the status bar provides input prompts as well as messages outlining the current

operation.

Selections can be made to set up structures, modify records, retrieve information, perform global database and file utility operations, and activate the online help system from the menu bar. All Assistant menus have an extensive help system including a How Do I option.

Additional menus with subselections are given with each item enabling inexperienced users to develop small to medium-sized applications with an easy-to-use interface.

This is unlike other database systems, which require users to either be knowledgeable of the precise syntax...

#### ABSTRACT:

##### TEXT:

...The database contains over 18,000 bibliographic citations and abstracts of professional literature, primarily of U.S. origin. Publication sources include books, journals, government reports, conference papers, state annual reports, curricula, and unpublished papers. Coverage includes materials on family violence: documents (1986-92), court cases (1965-86), and editorials and letters to the...

...database contains bibliographic records of A/V materials intended for a full range of audiences, from children to childcare and law enforcement professionals. The various media include audio and video tapes, games, films, filmstrips with audiocassettes, puppets, multimedia packages, and anatomically correct dolls. -- The State Statutes database contains summaries of the legislative provisions related to child maltreatment in the 50 states and U.S. territories. The summarized state and federal codified statutes cover the legal aspects of reporting child abuse cases, procedure, admissibility of evidence, child testimony, and other related information. -- A National Organizations database profiles those organizations working at a national or international level to prevent child abuse and family violence or to provide treatment or assistance to victims. Each regularly updated record contains full contact information and brief descriptions of organizational focus as well as services and products provided. -- The Program Directories database contains bibliographic records on local, state, federal, national and international treatment programs, family and youth services, shelter services, mental health programs, sexual abuse prevention and treatment programs, self-help groups, networking resources, and related information. -- Also included on the CD-ROM is a Child Abuse and Neglect Thesaurus database which compiles all of the 1,850 standardized words and phrases used in indexing documents on child maltreatment. -- The CD-ROM is IBM PC compatible...
